INTRODUCTION & BACKGROUND

01

Manual Ideation

Creating and iterating on fashion concepts manually requires significant time and expertise.

02

Specialist Tools

Professional design software can create technical and accessibility barriers for non-expert users.

03

Fragmented Flow

Design generation, product discovery, and virtual try-on are commonly handled as separate processes.

04

Opportunity

Generative AI can combine these stages into one unified fashion workflow.

PROBLEM STATEMENT

Traditional Workflow

Key Problems

Process Inefficiency

- Time-consuming design process
- Difficult visualization without specialist skills

Fragmented Ecosystem

- Fragmented and disconnected tools
- Separate product discovery and try-on workflows

High Barriers

- Limited accessibility for non-experts

SYSTEM ARCHITECTURE

API Routes

`/api/design` Cloudflare Workers AI
`/api/products/search` RapidAPI H&M Store
`/api/try-on` Hugging Face IDM-VTON
`/api/health` Service health check

Key Architecture Benefit

Single Vercel deployment handles both the React frontend and Python serverless API layer, while external AI services are securely accessed through server-side APIs.

Secrets remain server-side • Serverless • Scalable • No separate backend deployment

KEY FEATURES / MODULES

AI Fashion Studio

Create fashion designs from natural-language prompts.

Fashion Spec

Extract structured attributes like fabric, fit, and budget.

Image Generation

Generate fashion concepts using multiple AI models.

Product Match

Find matching real products through the H&M API.

Virtual Try-On

Generate interactive AI try-on results using IDM-VTON.

Collections

Save and manage your generated fashion designs.

Tech Pack

Generate structured technical fashion specifications.

Utilities

Download designs and copy specifications instantly.

PROPOSED SOLUTION

Unified AI Fashion Workflow

A unified end-to-end fashion ideation and visualization platform powered by Generative AI.

System Development — Technology Used

Frontend

- React 19
- Vite 8
- Tailwind CSS 4
- Lucide React

Backend / API

- Python
- Vercel Serverless
- Pydantic
- HTTPX

Artificial Intelligence

- Gemini 2.5 Flash
- Cloudflare AI
- IDM-VTON

External Services

- Hugging Face
- H&M Store API
- Vercel

Note: Your technology choices should match the latest repository rather than the older FastAPI architecture shown in the sample.

ALGORITHM & DEPLOYMENT

A. Recommendation Algorithm

Metadata Matching Weights:

Category Match 40%

Color Match 25%

Budget Fit 20%

Style / Brand 15%

Scoring Formula:

Score = Cat + Color + Budget + Style

** Structured metadata matching only; does not use vector embeddings for this ranking.*

B. Deployment & Architecture

CI/CD & Hosting Pipeline:

GitHub → Vercel → React + Python APIs → External APIs

Production API Routes:

GET /api/design

POST /api/products/search

POST /api/try-on

GET /api/health

RESULT

Project Outcomes

- ✓ AI-based fashion concept generation
- ✓ Structured fashion specification extraction
- ✓ Multiple AI image generation models
- ✓ Real H&M product recommendations
- ✓ IDM-VTON virtual try-on integration
- ✓ Before / After try-on experience
- ✓ Collections and Tech Pack functionality
- ✓ Download and copy utilities
- ✓ Serverless Vercel architecture
- ✓ Security and input validation

Key Result

Successfully integrated multiple AI and external services into a unified fashion design workflow.

CONCLUSION

Unified Platform

The **AI Fashion Design Generator** demonstrates how Generative AI, product APIs and computer-vision-based virtual try-on can be combined into a unified fashion platform.

IMPACT

The project reduces fragmentation in the fashion ideation workflow by bringing design generation, product discovery and virtual try-on into one application.

Connected Workflow

The system seamlessly connects each stage of fashion creation:

01 IDEATION

02 GENERATION

03 RECOMMENDATION

04 TRY-ON

FUTURE SCOPE

AI & Virtual Try-On

- Improved garment extraction
- Better garment preprocessing
- Higher-quality virtual try-on
- More advanced fashion generation

Recommendation

- More fashion marketplaces
- Personalized recommendations
- Advanced product similarity

Platform

- User authentication
- Cloud-based collections
- Analytics dashboard
- Mobile application

Please Note: These items represent future roadmap scope and are not currently completed features.
